Graduate Seminar 2

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Section 1 - Solving for $\psi(x, t)$

- We solve $\psi(x, t)$ by a numerical resolution of the Time-Dependent Schrödinger Equation (TDSE), i.e

$$i \frac{\partial}{\partial t} \psi(x, t) = \left(\hat{H}_a + \hat{V}_{\text{ext}}(t) \right) \psi(x, t), \quad \psi(x, 0) = \psi_0(x), \quad (1)$$

$$\hat{H}_a = -\frac{1}{2} \frac{d^2}{dx^2} - \kappa \delta(x), \quad \hat{V}_{\text{ext}}(t) = F(t)x. \quad (2)$$

$$E_0 = -\kappa^2/2, \quad \psi_0(x) = \kappa^{1/2} e^{-\kappa|x|}, \quad \kappa = 1, \quad (3)$$

$$E_k = k^2/2, \quad \psi_k^{(\pm)}(x) = e^{ikx} + R(\pm|k|)e^{\pm i|kx|}, \quad R(k) = \frac{i\kappa}{k - i\kappa}. \quad (4)$$

- The parameters of the laser we will be using are given by the relations

$$F(t) = F_0 e^{-(2t'/\tau)^2} \cos(\omega_0 t'), \quad 0 \leq t \leq T, \quad t' = t - T/2, \quad (5)$$

$$\tau = 2\pi n_{oc}/\omega_0, \quad n_{oc} = 5. \quad (6)$$

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Density, survival probability and PEMD

- The density probability of the wavefunction, at t is given by

$$\mathcal{D}(x, t) = |\psi(x, t)|^2 = \int \psi^*(x, t) \psi(x, t) dx. \quad (7)$$

- The coefficients of the projection of ψ are then, at t , and by definition, expressed as

$$a_0 = e^{iE_0 t} \int \psi_0(x) \psi(x, t) dx, \quad a_k = e^{iE_k t} \int \psi_k^{(-)*}(x) \psi(x, t) dx. \quad (8)$$

- Then,

$$P_0 = |a_0|^2, \quad \text{and} \quad P(k) = |a_k|^2. \quad (9)$$

- The ionization probability can then be found many different ways that should be consistent with each others

$$P_{\text{ion}} = \int P(k) \frac{dk}{2\pi} = 1 - P_0. \quad (10)$$

- $P(k)$ is the probability for the electron being ionized with the energy E_k .

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Observables

- For an arbitrary operator $\mathcal{O}$, we have

$$\mathcal{O}(t) = \int \psi^*(x, t) \mathcal{O} \psi(x, t) dx \quad (11)$$

- The the Fourier transform is obtained using

$$\mathcal{O}(\omega) = \int \mathcal{O}(t) e^{i\omega t} dt. \quad (12)$$

- Following Bransden and Joachain, "Quantum Mechanics (2000)" (see 11.145), we define the transition amplitude $\mathcal{O}_{ba}$ and probability P_{ba} between two states a and b such as

$$\mathcal{O}_{ba} = \int dx \psi_b^*(x) \mathcal{O} \psi_a(x), \quad P_{ba} = |\mathcal{O}_{ba}|^2. \quad (13)$$

When continuum states between q and $q + dq$ are involved, the quantity of interest is

$$P_{ba} dq = \left| \int dx \psi_b^*(x) \mathcal{O} \psi_a(x) \right|^2 dq. \quad (14)$$

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Length, velocity and acceleration

- We want to evaluate the quantities

$$d(t) = -\langle \hat{x} \rangle = -\int \psi^*(x, t) \hat{x} \psi(x, t) dx, \quad \text{and} \quad \dot{x}(t) = \frac{d}{dt} x(t), \quad (15)$$

$$p(t) = \langle \hat{p} \rangle = -i \int \psi^*(x, t) \frac{\partial}{\partial x} \psi(x, t) dx. \quad (16)$$

- Direct numerical differentiation can sometimes be avoided with the help of the Ehrenfest theorem and the commutator algebra

$$[\hat{p}^2, \hat{x}] = -2i\hat{p} \implies \hat{p} = i[\hat{H}, \hat{x}], \quad (17)$$

$$\frac{d}{dt} \langle \hat{x} \rangle = \langle \hat{p} \rangle, \quad \frac{d}{dt} \langle \hat{p} \rangle = \left\langle -\frac{\partial V_{\text{ext}}}{\partial x} \right\rangle. \quad (18)$$

and some others (see Bransden and Joachain, Quantum Mechanics (2000), p.531-532)

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

High Harmonic Generation (HHG) - (semi-classical approx.)

- In the classical approx., the spectrum is obtained from the following (Eq.(80))

$$Q_{\nu}^{(c)}(\omega) = \alpha^2 \omega^2 |\mathbf{A}_{\nu} \mathbf{d}(\omega)|^2, \quad (19)$$

Let us apply the following simplifications

$$\nu \longrightarrow \omega, \quad \mathbf{A}_{\nu} = \sqrt{\frac{2\pi c^2}{\omega L^3}} \mathbf{e}_{\nu} \longrightarrow A_{\omega}, \quad \text{and} \quad \alpha A_{\omega} = 1. \quad (20)$$

- So the observable we are considering here is

$$Q^{(c)}(\omega) = \omega^2 |d(\omega)|^2. \quad (21)$$

Additionally let us consider Eq. (104)

$$Q^{(c)}(\omega) = |p(\omega)|^2. \quad (22)$$

and, by virtue of $\mathbf{p}(t) = -\dot{\mathbf{d}}(t)$, which reads

$$Q^{(c)}(\omega) = \left| -\dot{\mathbf{d}}(\omega) \right|^2. \quad (23)$$

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Additional note from Ehrenfest theorem

- Using the integration by parts formula, we get

$$p(\omega) = \int_{-T/2}^{T/2} e^{i\omega t} \frac{dx(t)}{dt} dt, \quad u(t) = x(t), \quad v(t) = e^{i\omega t}, \quad (24)$$

thus

$$p(\omega) = \int_{-T/2}^{T/2} \frac{d}{dt} \left(e^{i\omega t} x(t) \right) dt - i\omega \int_{-T/2}^{T/2} e^{i\omega t} x(t) dt = \left[e^{i\omega t} x(t) \right]_{-T/2}^{T/2} - i\omega \int_{-T/2}^{T/2} e^{i\omega t} x(t) dt, \quad (25)$$

which reduces to (21) up to a constant.

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Transition amplitude

- From Yangaliev *et al.*, we have

$$p_{k0} = \int dx \psi_k^{(-)*}(x) \hat{p} \psi_0(x) = \frac{2k\mathcal{K}^{3/2}}{\mathcal{K}^2 + k^2}, \quad (26)$$

$$p_{kk'} = \int dx \psi_k^{(-)*}(x) \hat{p} \psi_{k'}^{(-)}(x) = 2\pi k \delta(k - k') - \frac{2\mathcal{K}}{k^2 - k'^2 + i\epsilon} \left(\frac{k'|k|}{|k| - i\mathcal{K}} - \frac{k|k'|}{|k'| + i\mathcal{K}} \right). \quad (27)$$

- Using (17), we can rewrite those expressions as

$$p_{k0} = -i(E_k - E_0) d_{k0}, \quad (28)$$

$$p_{kk'} = -i(E_k - E_{k'}) d_{kk'}. \quad (29)$$

- Those quantities are another way to study convergence, at the structural level

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Part 2 - Solving $\phi_\omega(x, t)$

- We are now interested in solving the following 1D problem with a ZRP

$$\begin{cases} i \frac{\partial}{\partial t} \psi(x, t) &= \left(\hat{H}_a + \hat{V}_{\text{ext}}(t) \right) \psi(x, t), \\ i \frac{\partial}{\partial t} \phi_\omega(x, t) &= \left(\hat{H}_a + \hat{V}_{\text{ext}}(t) \right) \phi_\omega(x, t) + e^{i\omega t} S(x, t) \end{cases} \quad (30)$$

where

$$\hat{H}_a = -\frac{1}{2} \frac{d^2}{dx^2} - \kappa \delta(x), \quad \hat{V}_{\text{ext}}(t) = F(t)x, \quad S(x, t) = \hat{p} \psi(x, t) \quad (31)$$

$$\phi_\omega(x, 0) = \frac{-i\kappa^{3/2}}{\omega} \text{sgn}(x) \left(e^{-\kappa|x|} - e^{-\kappa(\omega)|x|} \right), \quad \psi(x, 0) = \kappa^{1/2} e^{-\kappa|x|}, \quad (32)$$

$$\hat{p} = -id/dx, \quad \text{and} \quad \kappa(\omega) = \sqrt{\kappa^2 + 2\omega}. \quad (33)$$

$$\phi_\omega(x, t) = U(t, t_0) \phi_\omega(x, t_0) - i \int_{t_0}^t U(t - \tau) e^{i\omega\tau} S(x, \tau) d\tau. \quad (34)$$

High-order exponential splitting (composition methods) (Phys. Rev. A 101, 013410 (2020))

Yoshida (1990) - 4th-order symmetric decomposition

$$\phi_\omega(x, t + \Delta t) = U_4(t + \Delta t, t)\phi_\omega(x, t) - i \int_t^{t+\Delta t} U_4(t + \Delta t - \tau) e^{i\omega\tau} S(x, \tau) d\tau. \quad (34)$$

- From the following Strang operator $U(h) = e^{-iE_n h/2} e^{-iV_{\text{ext}}(t+h/2)h} e^{-iE_n h/2}$, we compose

$$U_4(h) = U(c_1 h) U(c_2 h) U(c_1 h), \quad \text{with} \quad c_1 = \frac{1}{2 - 2^{1/3}}, \quad c_2 = -\frac{2^{1/3}}{2 - 2^{1/3}}. \quad (35)$$

- More precisely, we can observe the following

Theorem 8.6 (Hairer, Solving ODE II p.554)

If Ψ_h represent a one-step method that is symmetric, of order $p = 2k$ and defined in the domain, then the relations

$$2c_1 + c_2 = 1, \quad 2c_1^{p+1} + c_2^{p+1} = 0, \quad (36)$$

imply that the composition (35) is of order $p + 2$.

If you start from the Strang method, then in the above $k = 1$.

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Midpoint Duhamel - 2nd order approximation

$$\phi_{\omega}(x, t + \Delta t) = U(t + \Delta t, t)\phi_{\omega}(x, t) - i \int_t^{t+\Delta t} U(t + \Delta t - \tau) e^{i\omega\tau} S(x, \tau) d\tau. \quad (34)$$

- We can show that the above can be expressed as

$$\phi_{n+1}^{\omega} = U(\Delta t)\phi_n^{\omega} - i\Delta t e^{i\omega t_{n+1/2}} S_{n+1/2}, \quad (37)$$

where the source is evaluated at $t_{n+1/2} = t + \Delta t/2$, i.e and $S_{n+1/2} = U(\Delta t/2)S_n$, with $S_n = S(x, t_n)$

- This is the midpoint Duhamel formula, of order 2.
- It's what will allow us to get familiar with the numerical intricacies of our problem
- The driver shall be regarded as decent if the expected order is met

Geometric propagators

Simpson Duhamel - 4th-order quadrature

$$\phi_\omega(x, t + \Delta t) = U_4(t + \Delta t, t)\phi_\omega(x, t) - i \int_t^{t+\Delta t} U_4(t + \Delta t - \tau) e^{i\omega\tau} S(x, \tau) d\tau. \quad (34)$$

- The Simpson quadrature consists in writing

$$\phi_{n+1}^\omega = U_4(\Delta t)\phi_n^\omega - \frac{i\Delta t}{6} \left(U_4(\Delta t)e^{i\omega t_n} S_n + 4U_4(\Delta t/2)e^{i\omega t_{n+\frac{1}{2}}} S_{n+\frac{1}{2}} + U_4(0)e^{i\omega t_{n+1}} S_{n+1} \right) \quad (38)$$

where the source is evaluated at t_n , $t_{n+\frac{1}{2}}$ and t_{n+1}

- This is the Simpson Duhamel formula, of order 4.
- It requires a 4th order evolution operator to work
- Simpson-Duhamel multiplies the number of operations required by Midpoint-Duhamel by 3.

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Observables

$$b_{0\omega}(T) = e^{iE_0 T} \int \psi_0(x) \phi_\omega(x, T) dx, \quad (39)$$

$$b_{k\omega}(T) = e^{iE_k T} \int \psi_k^{(-)*}(x) \phi_\omega(x, T) dx, \quad (40)$$

$$b_{0\omega} = b_{0\omega}(T) + \int \frac{e^{i(E_0 + \omega - E_{k'})T} p_{0k'} a_{k'}}{E_0 + \omega - E_{k'} + i0} \frac{dk'}{2\pi} \quad (41)$$

$$b_{k\omega} = b_{k\omega}(T) + \frac{e^{i(E_k + \omega - E_0)T} p_{k0} a_0}{E_k + \omega - E_0} + \int \frac{e^{i(E_k + \omega - E_{k'})T} p_{kk'} a_{k'}}{E_k + \omega - E_{k'} + i0} \frac{dk'}{2\pi} \quad (42)$$

$$Q(\omega) = |b_{0\omega}|^2 + \int |b_{k\omega}|^2 \frac{dk}{2\pi} \quad (43)$$

 $\omega_0 = 0.114$ a.u.
 $F_0 = 0.03$ a.u., $T = 5\tau$
 $n_{\text{steps}} = 15000$, $\Delta t = 0.092$

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Quantum High Harmonic generation, for ϕ_ω with $\omega = 0.5$ a.u.

N_p	N_s	q	$x_{\max}$	$b_0(\omega)$	$Q(\omega)$
30	200	1/2	9000	12.7406754	6.3649490×10^9
40	200	0	4000	12.7400795	6.2368512×10^3
40	200	1/2	12000	12.7412440	2.6370941×10^7
50	200	1/2	15000	12.7976569	1.2622004×10^7

For this laser intensity and frequency, the reference result is

$$Q(\omega) \sim 1e - 5$$

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Self conv. test results for real tests, both orders

$$E \sim C(\Delta t)^p$$

$$\log E = \log C + p \log(\Delta t)$$

$$C_2 \sim 1.66(-5)$$

$$C_4 \sim 2.31(-7)$$

$$N_p = 20, \quad N_s = 100$$

$$x_{\max} \sim N_p N_s (1 + 1/4)/2$$

$$\omega_0 = 0.114 \text{ a.u.}$$

$$F_0 = 0.03 \text{ a.u.}, \quad T = 5\tau$$

$$n_{\text{steps}} = 20000, \quad \Delta t_0 = 0.0689$$

Level	Δt (relative)	E_ψ	E_ϕ	p_ψ / p_ϕ
1	$2\Delta t_0$	0.6673536(-4)	0.5532128(-3)	—
2	Δt_0	0.1661859(-4)	0.1378364(-3)	2.006 / 2.005
3	$\Delta t_0/2$	0.4150871(-5)	0.3445575(-4)	2.001 / 2.000
Observed order				2.0013/2.0001

Level	Δt (relative)	E_ψ	E_ϕ	p_ψ / p_ϕ
1	$2\Delta t_0$	0.3627616(-5)	0.3289495(-4)	—
2	Δt_0	0.2322254(-6)	0.2587140(-5)	3.965 / 3.668
3	$\Delta t_0/2$	0.1460063(-7)	0.1720141(-6)	3.991 / 3.910
Observed order				3.9914/3.9108

$$p_k^{\text{self}} = (\text{err}_{k-1}/\text{err}_k) / \log(2)$$

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Δt Time step convergence for the inhomogeneous problem

1st column : order 2

2nd column : order 4

$N_p = 20, \quad N_s = 200$

$x_{\max} \sim N_p N_s (1 + 1/4)/2$

$\omega_0 = 0.114 \text{ a.u.}$

$F_0 = 0.03 \text{ a.u.}, \quad T = 5\tau$

$n_{\text{steps}} = 15000, \quad \Delta t = 0.092$

- No improvement brought by the order 4 scheme whatsoever
- In principle, order 4 should require less steps, i.e. tolerate a
- $\Delta t \leq 0.08$ sufficient for convergence for the inhomogeneous problem

Quantum theory of radiation by nonstationary systems with application to high-order harmonic generation (Phys. Rev. A 101, 013410 (2020))

Space grid convergence for the homogeneous problem

$$N_p = 20, \quad N_s = 200$$

$$x_{\max} \sim N_p N_s (1 + q)/2$$

$$\omega_0 = 0.114 \text{ a.u.}$$

$$F_0 = 0.03 \text{ a.u.}, \quad T = 5\tau$$

$$\text{nsteps} = 15000, \quad \Delta t = 0.092$$
